

# Follow the Molecule from wellhead through the intricate midstream process

## **Production Chain:** Wells To Facilities

**XI has found a way to make the difficult look easy.**

XI's **AssetBook Production Chain:** Wells to Facilities module revolutionizes Oil & Gas business development analysis with a few clicks, unlocking a critical assessment piece – where does production flow to after it leaves the well, and what steps does it take on its path to market? The module enables instantaneous dynamic visualization of the production chain, represented as a grid or geographic spider map, offering key insights essential for development and planning.

From over-the-fence scoping, competitor analysis, operatorship and utilization rates, to A&D decision-making and crucial JV considerations, this tool provides a fast, comprehensive solution at your fingertips. Elevate your strategic planning with a seamless and insightful exploration of molecule flow, transforming complex analyses into a streamlined and efficient process, **all from within your existing AssetBook workflow.**

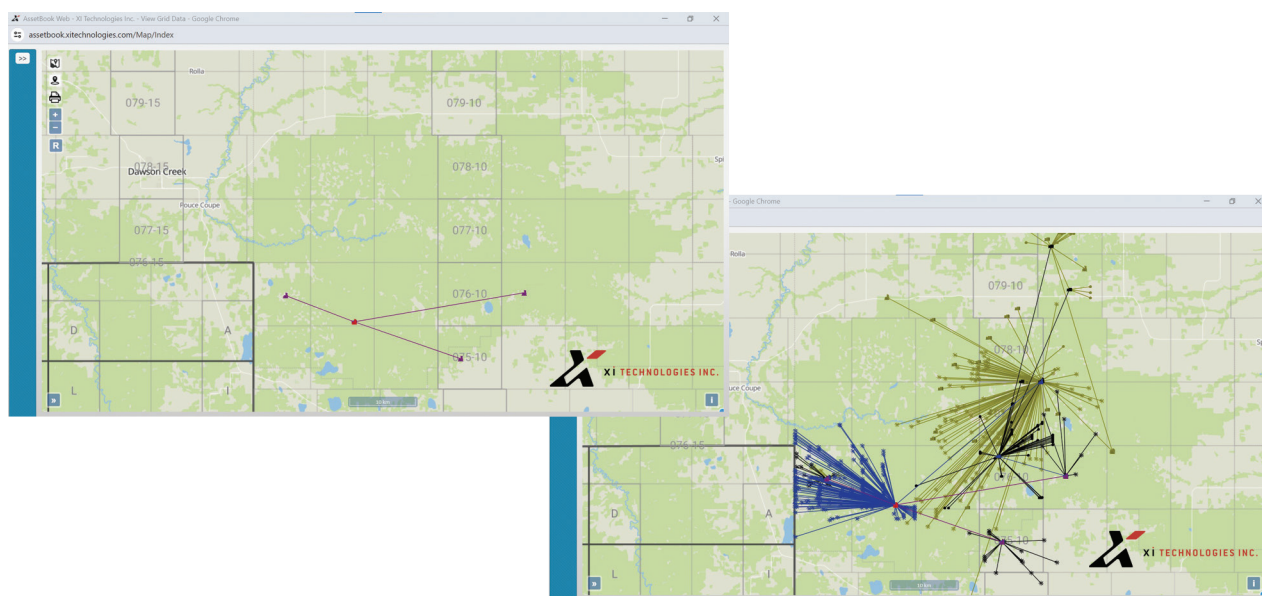

**AssetBook** is the ultimate industry intelligence source for Canadian E&P companies and anyone who does business with them. It gives you instant access to everything you need to know about every company in the WCSB and is an integral tool for strategic decision making.

## Easily map the flow to likely processing and/or market points with speed and simplicity.

Navigating the complexities of the oil and gas production chain has always been challenging, especially when it comes to tracking the journey of wells to facilities. What used to be a time-consuming process, taking days or even weeks to gather, sort, and map multiple wells and their paths to market, is now seamlessly streamlined with AssetBook Production Chain.

1. Map production flow pathways - generate instant “spider” maps, starting from wells or facilities to likely market point\*
2. Visualize the entire production chain in map or grid view, by single well, multi well or grouped by likely market point
3. Toggle on forward or backward steps for a comprehensive trace of where production flows
4. View production path based on product – Gas, Oil, NGLs
5. Export the step-by-step progression of flow for multiple wells in a grid of all tied in wells and facilities in a production chain, with detailed facility, operator, and volumetric data

*\*Likely market point is based on the product's built-in intelligence (smart algorithms).*

View the entire chain from wells or facilities, geographically on a map. Toggle on and off each forwards or backwards step for a comprehensive trace of where production flows. Break down flow based on product – Gas, Oil, NGLs. Quickly export all tied in wells and facilities in a production chain, including operators in simple .csv or .xlsx format for further analysis.
